

Garment for Use with Sensitive Skin, and Method and Fabric for Use in Making Sam

Abstract of the Disclosure

5

Garments designed for use by people with sensitive skin, such as those suffering from eczema or dermatitis, which enhance wearer comfort are described. The garments have a lower coefficient of friction and superior moisture transport properties relative to conventional cotton T-shirts currently recommended for wear by sensitive skin sufferers. The garments are made from polyester fabrics which are specially constructed to minimize the coefficient of friction, optimize moisture transport, and provide antimicrobial characteristics. Fabrics and methods of making and using the fabrics are also described.
